BIOCHEMISTRY REPORT

| Test Name | Result | Status Bio. Ref. Interval | Method |
|-------------------|--------|---------------------------|-----------------|
| Creatinine, Serum | 11.06 | H 0.7 - 1.3 Unit :mg/dl | Modified Jaffes |

Test Interpretation :

Clinical Significance

- The significance of single creatinine value must be interpreted in light of the patients muscle mass. A patient with a greater muscle mass will have a higher creatinine concentration. The trend of serum creatinine concentrations over time is more important than absolute creatinine concentration. Serum creatinine concentrations may increase when an ACE inhibitor (ACE) is taken. The assay could be affected mildly and may result in anomalous values if serum samples have heterophilic antibodies, hemolyzed, icteric or lipemic.

|------------------------|-------|--------------------------------------------|--------|
| Glucose Random, Plasma | 116.1 | < 200 Normal ≥ 200 Diabetes Unit :mg/dl | GODPOD |
|------------------------|-------|--------------------------------------------|--------|

Test Interpretation :

- Kindly correlate clinically with intake of hypoglycemic agents, drug dosage variations and other drug interactions.
- A negative test result only shows that the person does not have diabetes at the time of testing. It does not mean that the person will never get diabetics in future, which is why an Annual Health Check up is essential.
- I.G.T = Impaired Glucose Tolerance.
